HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

TEMPORAL STACK SPECKLE AND TARGET

FILTERING FOR ENVIRONMENTAL APPLICATIONS

<u>Florent Michenot^{1*}</u>, Regis Guinvarc'h¹, and Laetitia Thirion-Lefevre¹

Introduction

- SAR images affected by speckle and ephemeral targets
- Spatial speckle filtering degrades spatial resolution
- **Objective:** filter both from <u>individual images</u> in a temporal stack
 - Modified Frozen Background Reference (FBR) algorithm
 - Temporal interpolation after removal of anomalous dates
- Intensity-only images, for now

Method

- Frozen Background algorithm [2] (FBR): thresholding on temporal coefficient of variation (CV)
- Theoretical threshold γ from [3], <u>constant</u> over the stack, function of the Equivalent Number of Looks L (ENL):

$$\gamma = \sqrt{\frac{\Gamma(L)\Gamma(L+1)}{\Gamma(L+1/2)^2} - 1}$$

- Temporal interpolation: conservation of temporal trend
- Different behaviors depending on whether the temporal mean is recomputed at every iteration or not (Fig. 3)

Figure 3: The temporal profile for one pixel and the output profiles for different mean recomputation settings.

Figure 1: Optical images of the "Pelouse de la Muette": (top) without the fair (2020/04/24). (*bottom*) *with the fair* (2020/09/13) © Planet Labs PBC [1]

Figure 2: SAR temporal mean over the "Pelouse de la Muette" (ascending VV, 30 dates).

> Figure 4: Graph of the process, applied to the "Pelouse de la Muette". The temporal profile plotted is for an individual pixel affected by the fair (peak on the right).

d)

Application: Pelouse de la Muette, Paris, France

Area of interest:

- "Pelouse de la Muette", western part of Paris, France
- A fair takes place there for less than **2 months** every year
- Temporal stack of 30 Sentinel-1 images (ascending pass, VV polarisation) covering one year
- Two images taken from the input stack (Fig. 5a and 5b), along with their output images (5c and 5d)

Target and speckle filtering:

Figure 6: Difference (in dB) between input and output images. The large dark blue area shows the high percentage of pixels that are unaffected by the algorithm. Quegan filter [4] for reference.

Temporal trends conservation:

C)

Figure 7: Temporal profile of forested area of interest (ascending and descending VH, 30 dates each, smoothed).

Figure 5: SAR images of the "Pelouse de la Muette": (a) taken on 2020/04/22, ascending VV, without the fair. (b) taken on 2020/09/13, ascending VV, with the fair. (c) output of (a), mostly speckle reduction. (d) output of (b), speckle reduction and <u>removal of the fair</u>

Conclusion

- Speckle and ephemeral target filtering over SAR time-series
- Conservation of spatial resolution
- Conservation of temporal trends (FBR over window)
- Intensity-only, phase (or phase difference) of rejected pixels could be interpolated
- Ephemeral targets could be reintroduced, if discriminated from speckle
